

## POWDERSAN 2

Sanitizing powder for animal bedding

### FEATURES

**POWDERSAN 2** is a powdered preparation containing a stabilized active oxygen donor. This peculiarity distinguishes it from both chlorine-releasing products and aldehydes that can prove to be medium-or long-term, sensitizing or irritating to animals.

Its active content remains unchanged until it comes into contact with substances with high water content, such as animal defects.

In this case, the different water availability makes gradual solubility and consequently also the release of active oxygen.

Its oxidative power is able to break down the bad odor emissions and control the bacteria that proliferates in the bedding of the stables.

Thus, a control of the hygienic state of the pavements on which the animals are kept is maintained.

The composition of the product also allows the absorption of moisture, reducing the Aw-factor necessary for microbial growth.

Recommended product for bovine, ovine / caprine and pig farms.

### CHEMICAL-PHYSICAL DATA

Physical state: powder  
Color : from white to yellow  
Odor : characteristic

### HOW TO USE

Spread this product directly onto the bedding in the absence of the animal. Apply more product near the largest amount of liquids present.

Subsequent treatments for maintenance purposes should be repeated on the basis of their experience.

### STORAGE

Keep containers tightly closed in a cool, dry place.

During application, wear plastic gloves, a mask suitable for protecting the respiratory tract from dust, and always remove animals from the litter. Also avoid contact with any other chemical
